

OPTIC HOLDOVER HELPER WHEN ZEROED FOR 25YRDS

Make sure to zero your optic first before using this target

This target is simply to help you calibrate and identify your holdovers at different distance. Zero your optic at 25 and then shoot 3 rounds at each target, making sure to keep your point of aim consistent with the centre of the targets. Each time you move forward, you will notice your rounds land lower than the previous one. Go slow - this isn't a drill and isn't about time. It's merely to help you get a visual representation of the POI shift.

Once you've gone through once, patch the target and attempt to hit the green circle with one shot at each distance
